

Online Inventory & Sales Management

The solution offers comprehensive inventory control and order tracking system that combines powerful features for manufacturers and distributors. Users (sales department) can easily look at inventory status, see what's available, quickly determine what needs to be reordered and with a few clicks, create a batch of purchase orders for multiple vendors at the same time.

On receiving a purchase order from customer, users (sales department) create a sales order for both inventory and non inventory items. With a single click, software determines what is in stock and creates necessary shipping documents.

Users can create a work order. The work order contains a "Component List" which details the quantity and location of components that go into production. Solution also offers flexible costing functionality to its users. Using "Bill of Materials", users select which components and how many of each go into a finished good, solution automatically computes the cost, the mark up and the mark up percentage automatically. Even with this software, users can easily & quickly see which sales orders are open and ready to ship. Users can view sales orders by customers, by item ordered, by customer purchase order & also by shipping date.

This solution also offers flexibility to see which work orders are waiting for components, ready for production, in production & finished. Work orders can also be seen by customers, by item ordered and by shipping date.

Overall Features:

Mobile Application Features

- Bar Scanning
- Order from Suppliers
